

Company: Pacific Power Source
Item Description: AC Power Source with Transit Case
Model Number: 360LSXM/M23004
Quantity: 2 ea.
Cost: [REDACTED]

The Precision Guided Missile Section within the Munitions Flight, in the 20th Equipment Maintenance Squadron inspects, maintains, assembles (including emergency build-up), disassembles, and tests assigned missiles, other PGM, associated components, training items, support equipment, and containers.

The Pacific Power Source which is the sole source for the Hertz Converter requirement will:

- 1) Install a FSL4-FR type female receptacle in a junction box mounted on the power source rear panel.
- 2) Installs a "Soft Start" slow turn on circuit to limit inrush current.
- 3) Provide custom firmware to control AC Output Voltage.
- 4) Install the complete assembly in a double-lid composite transit case with slide rails.
- 5) Input power cable for the power source is terminate with a Hubbel Bryant model 72130NP

Currently the Precision Guided Munitions Flight that is responsible for Squadron inspecting, maintaining, assembling (including emergency build-up), disassembling, and testing assigned missiles, other PGM, associated components, training items, support equipment, and containers does not have the appropriate power source to complete its mission. They rely on another section within the Munitions Flight to have availability in their schedule to utilize their power source to support the Flightline Flying hour Program with AGM 88's to successfully complete the Pilot Training Sortie Hours. Relying on another section to utilize their facility power not only hinder the workload on that section but it creates more man hours and constraints for everyone involved to successfully support the three Fighter Group Squadrons.
