

STATEMENT OF WORK
FOR
SUPPLY OF DEWESOFT SIRIUS DATA ACQUISITION SYSTEM

1. BACKGROUND

Aberdeen Test Center (ATC) Ballistic Instrumentation Division (BID) has recently replaced its fleet of Data Acquisition Systems (DAS). Other organizations within ATC have started using Dewesoft instrumentation. The requested DEWESoft SIRIUS DAS family is the only supply that will satisfy agency requirements. Due to the strict electrical requirements and operational needs no other offeror has been able to provide instrumentation that will meet our needs. Additionally, various software packages are integrated with the use of Dewesoft and changing to a new vendor would put a time and cost burden on the government to develop new software procedures. Estimates of evaluating a new system if paper requirements are met are upwards of a year. Request is for a 5-year Indefinite Quantity Indefinite Delivery (IDIQ) contract starting in April of 2025, that will allow for incidental DAS replacements to be procured from funding issued to ATC. IDIQ is requested as future needs are fluid depending on the test environment. The IDIQ allows for rapid expansion of test capabilities, as well as quick replacements in the case of system failures. The parts list below are items that need to be purchased quickly when items need to be replaced, although no quantity can be estimated at this time.

2. OBJECTIVE

The objective of this requirement is to obtain an IDIQ supply contract to provide supply of the SIRIUS DAS and support equipment to the requesting agency. No additional warranties are needed other than the standard 7-year warranty as prescribed by the supplier. Maintenance is addressed with a separate contract W91ZLK-24-P-0039. This maintenance is part of ATC's internal operation budget. No additional installation of material will be needed. Contractor will not need access to ATC for purposes of installation of equipment or training.

3. SCOPE OF WORK

The contractor shall provide a data acquisition system and peripherals with the following physical, electrical, and operational characteristics.

Electrical:

- Effective Number of Bits: 13, Ideally 16
- Sample Time Propagation: +/- 2 samples
- Common Mode Rejection Ratio: -80dB
- Sample Rate: 1M Samples Per Second
- Crosstalk: -80dB, Ideally -100dB

Physical:

- Temperature Range: -30 to 40 °C
- Minimum of 128 Channel count, with option to expand to 500 without software changes
- Universal inputs that allow for Voltage, IEPE, Charge, and Thermocouple inputs
- TED's capable inputs
- In house capability for calibration of amplifiers
- Watertight/Ruggedized version of a data acquisition system must be available. IP67 or IP68 rated device or equivalent. Shock resistant up to 90G's. Cannot be a separate amplifier family for waterproof versions.

Operational:

- DAS software that is included with the hardware without annual repurchase of a license and allows for open-source API programming.
- Both hardware and software triggers
- Data must be simultaneously sampled
- A valid Verification and Validation must have been performed at ATC on the hardware
- Must be compatible with existing Dewesoft hardware
- Must be compatible with existing software developments and the BTSX analyzer

The Contractor shall provide any of the parts listed in Table 1 within sixteen weeks of formal request and funding from ATC. The parts are to be a Commercial off the Shelf (COTS) item. Items may be shipped to the following point of contact:

USA Aberdeen Test Center

Attn: [REDACTED]

6850 Lanyard Rd

Aberdeen Proving Ground, MD 21005, USA
