

Commercial LEO Destination Phase 2 Certification and Services Industry Acquisition Update

Angela Hart

Program Manager, Commercial LEO Development Program

COMMERCIAL LEO
DEVELOPMENT
PROGRAM

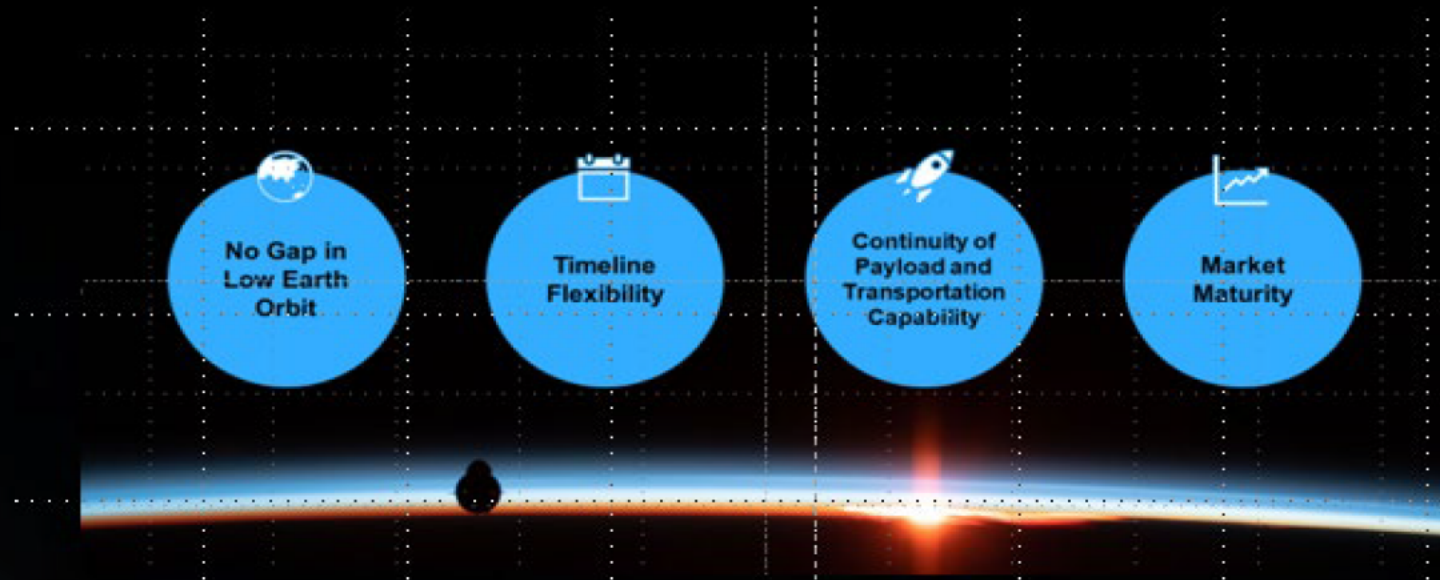

January 2025 (Revised 27JAN2025)

Baseline Acquisition Strategy

- ❖ NASA long term goal is still to purchase end-to-end mission services as one of many customers from a commercial owner/operator of a CLD. Services would include:
 - Crew pre-flight and on-orbit training
 - Pre- and post-flight payload processing
 - In-flight accommodation and support for 2 NASA crew continuously living in LEO
 - In-flight accommodations and support for NASA payloads, activities, studies, and technology demonstrations
 - Crew and cargo transport to and from the CLD (Initially to be provided by NASA)
- ❖ A full and open competition for services will be conducted among U.S. commercial providers.
 - CLD providers may propose an evolutionary approach to develop destination capabilities
 - On-ramp opportunities will be included for future commercial advancements
- ❖ CLD and transportation providers will be responsible for meeting NASA's certification requirements
- ❖ CLD capabilities need to support the LEO Microgravity Strategy Goals & Objectives
 - Decomposition of the goals and objectives to characteristics & needs, functions and use cases will be done Jan-Feb, 2025 and synced to CLDP draft requirements

Acquisition Updates

- ❖ In December 2024, NASA finalized a reassessment of the overall acquisition strategy for procurement of services from Commercial LEO Destinations (CLD) and a number of changes have been made to address key challenges and risks identified

The following key updates are being implemented:

- ❖ Providing government furnished crew and cargo transportation for NASA missions
- ❖ Offering other additional government furnished services and equipment
- ❖ Allowing interim offering of crew tended short duration missions until destination achieves full capability

Acquisition Strategy Updates: Transportation

- ❖ Initially, NASA will provide transportation, from current certified vehicle fleet, for all missions associated with NASA services (Crew and Cargo)
 - NASA will provide transportation for an initial set of missions, by contracting directly with transportation providers, and transition to CLD end-to-end service (including transportation) over time (TBD)
 - Specific Gov't services that will be provided or offered as part of government-provided transportation are still being assessed.
- ❖ NASA plans to order full crew and cargo missions and plans to offer excess capacity/seats to the provider.
 - NASA envisions mixed missions including NASA, IP and other private astronauts.
 - A type of value exchange for use of NASA-provided transportation is expected for non-NASA customers.
 - CLD Providers may propose an alternative approach as part of their proposal if they do not want to utilize NASA-procured transportation.
- ❖ CLD Provider is responsible for Private Astronaut Missions, assembly or cargo outfitting missions. Providers can propose NASA provide, or partner with the provider, to provide cargo transportation for outfitting flights, if those outfitting flights include NASA needs
- ❖ NASA may choose to on-ramp new certified vehicles and/or utilize International Partner-provided vehicles for transportation missions.

Acquisition Strategy Updates: Evolutionary Approach

- ❖ NASA will allow CLD providers to propose an evolutionary approach with the following additional assumptions:
 - Minimum Initial Operating Capability (Min IOC) required by December 2029
 - Short-term crew tended missions of 2 NASA crew for 1-3 months may be offered
 - Additional details of Min IOC still in work
 - Continuous Crew missions required by 2030
 - Includes 2 NASA crew continuously in LEO
 - Full Operating Capability (FOC) required by December 2031
 - Includes 2 NASA crew continuously in LEO for 6-month missions
 - Additional shorter or longer missions may also be of NASA interest
 - Provides all NASA's Utilization needs
 - Additional details of FOC still in work
 - Additional capabilities beyond "full capability" may be offered and/or requested by NASA

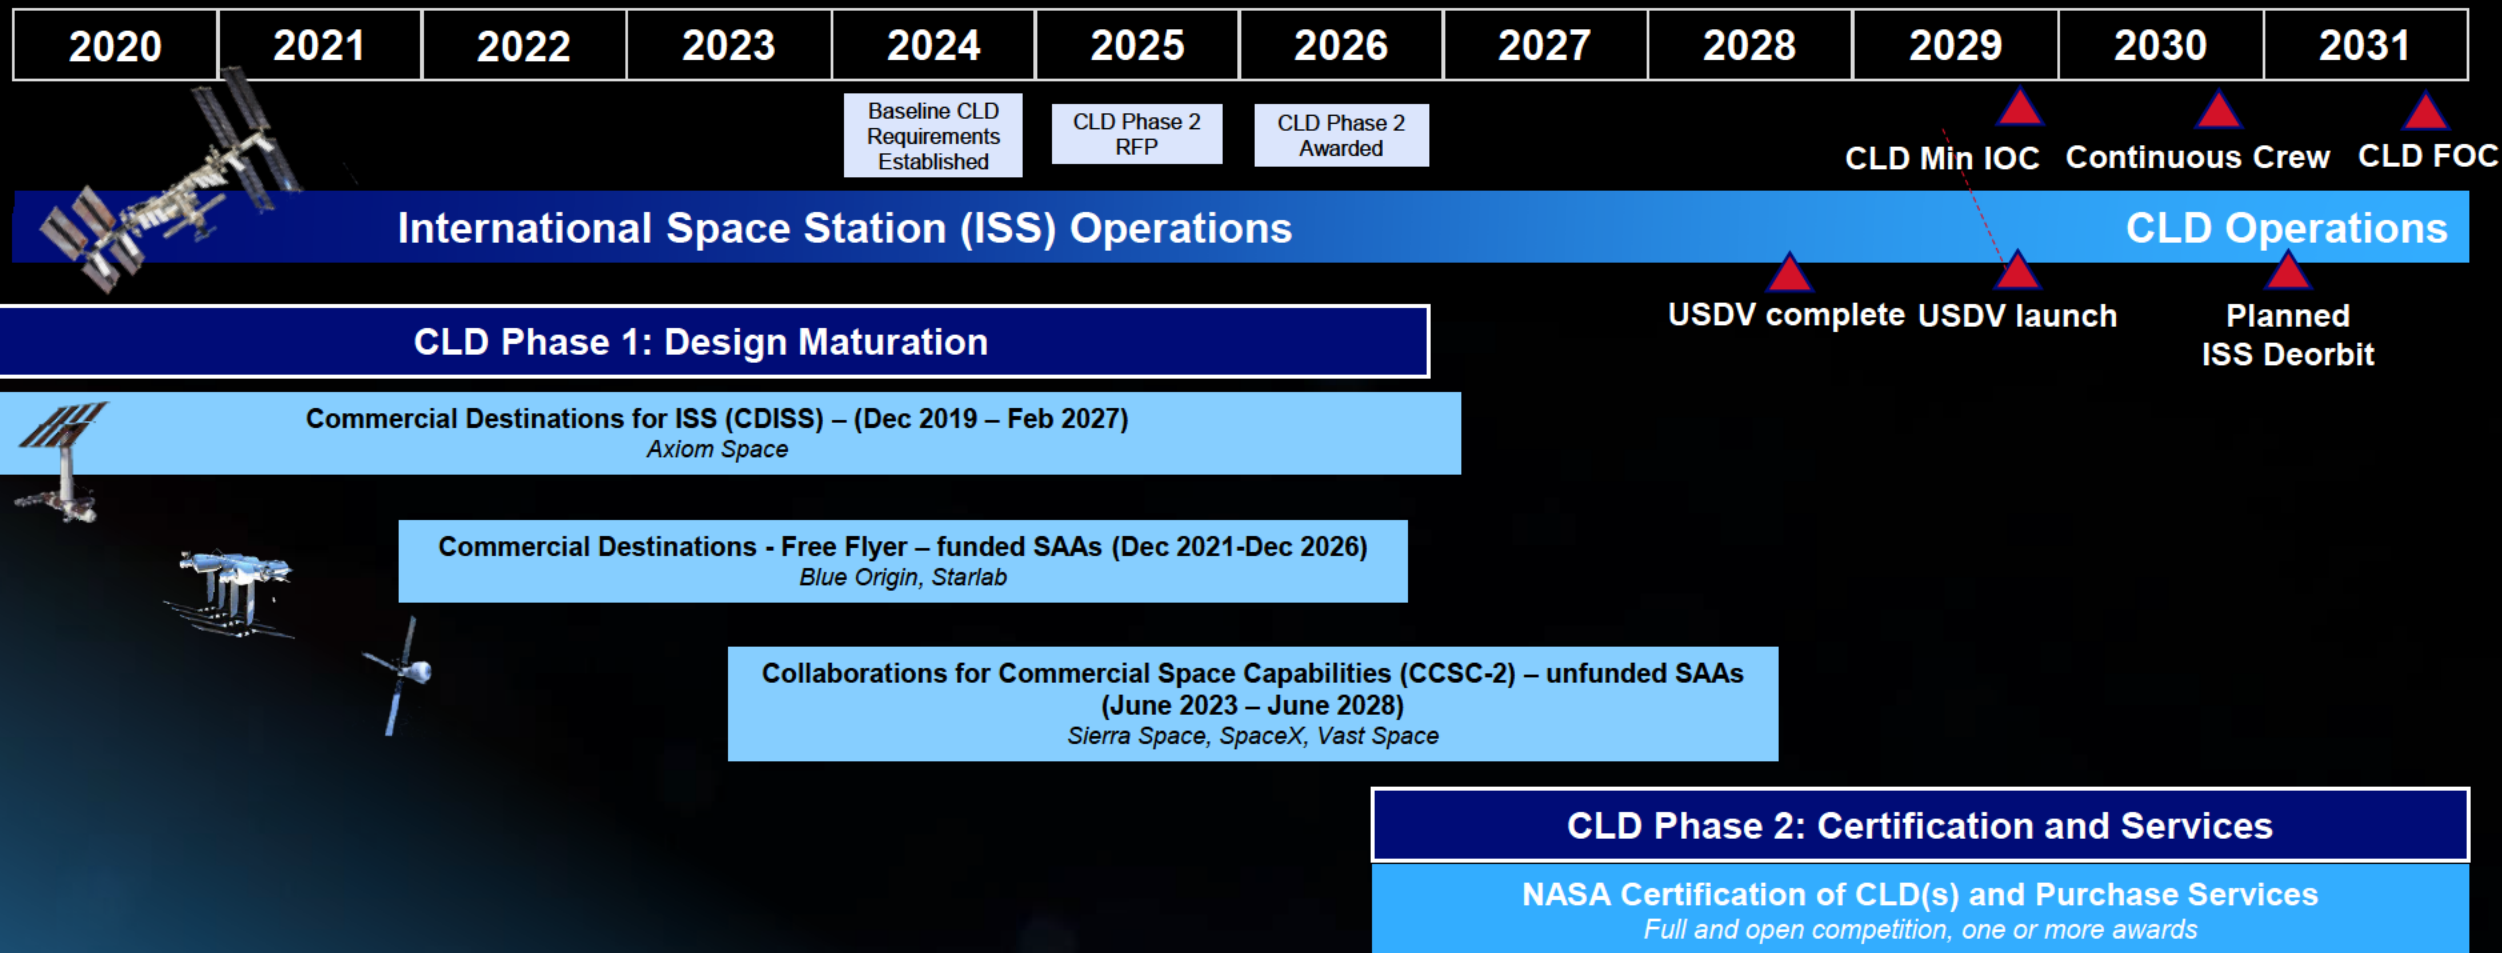

Acquisition Strategy Updates: GTA & RSAA

- ❖ CLD providers will develop, own, and operate their destinations with NASA support
 - NASA is planning to offer more support/services than previously planned
 - May include NASA-provided or jointly developed systems
 - NASA is finalizing a list of services/equipment to be offered and plans to provide at a future Industry Briefing or in the Draft RFP.
 - NASA expects to leverage GTA & RSAA processes used in similar NASA Programs

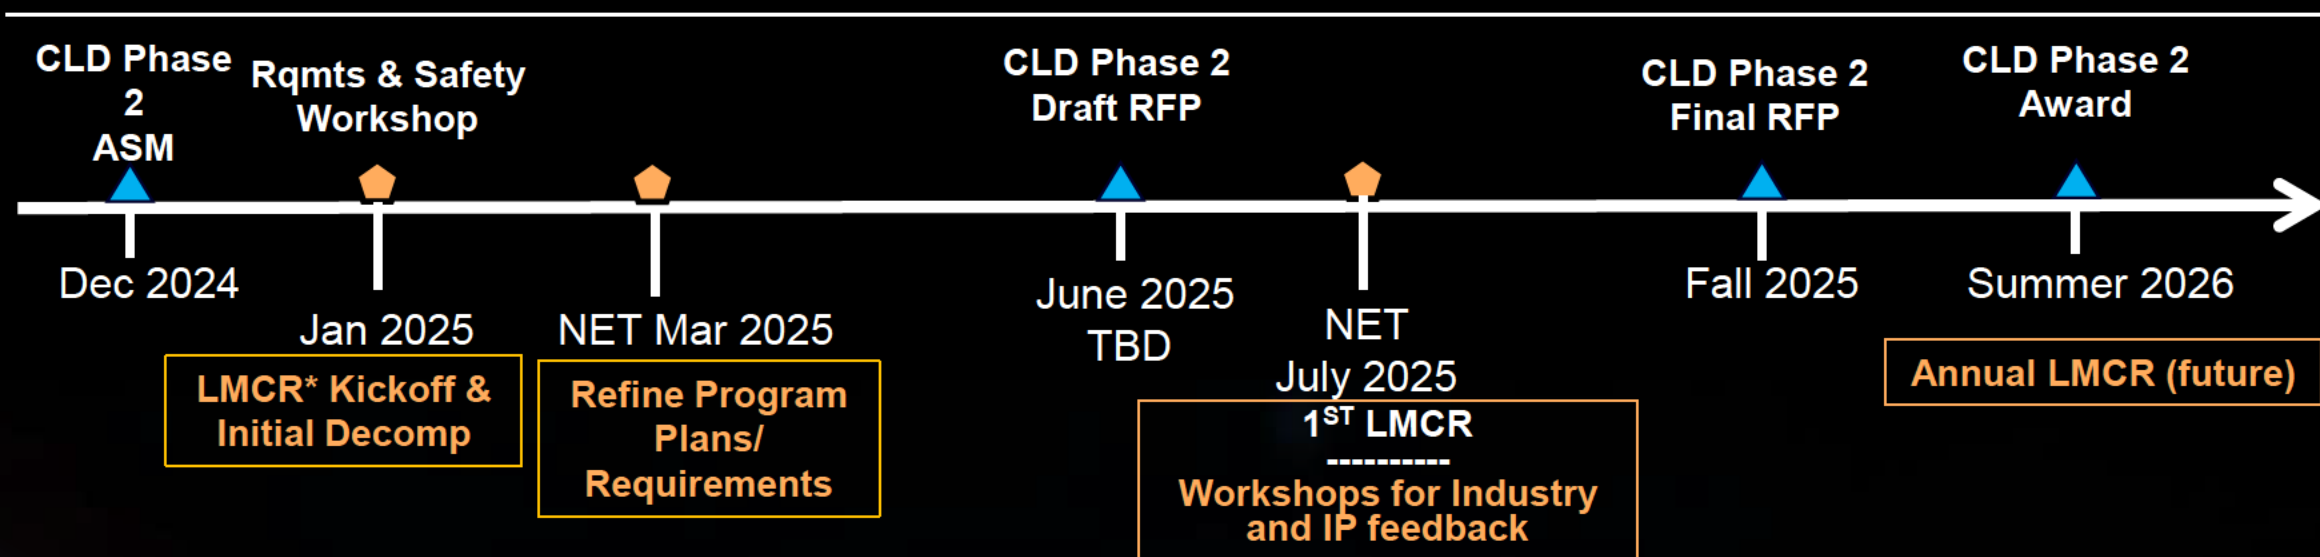

LEO Transition Schedule

CLD Acquisition Strategy Schedule (Notional)

* LMCR is the LEO Microgravity Strategy Concept Review

- **Detailed Acquisition schedule is under development based on ASM updates and alignment with LMS decomposition schedule**
 - Overall Acquisition schedule has not changed
- **Additional Industry touch points are also planned prior to draft RFP**
 - Requirements and Safety Workshop January 28-30 with release of documents
 - Industry Day planned prior to Draft RFP including Legal, liability, Minimum IOC, Minimum Buy, and Evaluation criteria
 - Additional workshops may be provided prior to RFP if data available earlier

Summary of Acquisition Approach Decisions

- CLD & Transportation contracted for separately initially to address end-to-end service complexities and stability of the transportation industry
- Increased GTA/GFE/RSAA offerings to assist CLD providers decrease schedule and technical risk where needed
- Use of Evolutionary Approach with Minimum IOC that supports LEO Microgravity Strategy Objectives and decreases risk of gap
- NASA may accept offerings of short duration mission/crew tended, if proposed from 2029-2031, to allow for early services during overlap period with ISS to decrease risk of a gap in LEO
