

[REDACTED]

Limited-Sources Justification

1. Defense Logistics Agency (DLA) Troop Support, Medical Supplier Operations, Electronic Catalog (ECAT) Division is the contracting activity.

2. This justification is for the acquisition of a unique and highly specialized brand name, a product essential to the Government's requirements under [REDACTED] Medical/Surgical Electronic Catalog (ECAT) contract number [REDACTED]
[REDACTED]

3. Walter Reed National Military Medical Center has the following requirement:

Item Description(s): BF-UC190F Endobronchial Ultrasound (EBUS) Bronchoscope WITH ULTRASOUND CABLE

Manufacturer: Olympus America Inc. (Olympus)

Manufacturer Part Number: BF-UC190F-A

Total Quantity: 7
[REDACTED]

<i>Item/Description</i>	<i>Part #</i>	<i>Qty.</i>
BF-UC190F SCOPE WITH ULTRASOUND CABLE	BF-UC190F-A	7

An endoscopy is an examination of a patient's GI Tract using a camera, either stomach, colon or anything in between. The name of the camera utilized for this procedure is an Endoscope. A bronchoscope is a thin, lighted tube that is inserted into the airways through the nose or mouth and is used to inspect the interior of the tracheobronchial tree. Bronchoscopy is a procedure that allows doctors to look at the lungs and air passages.

The EBUS bronchoscopes being replaced by the BF-UC190 series have reached the end of life and are obsolete as Olympus no longer supplies Charge-Coupled Device (CCD) chips for their repairs. These bronchoscopes are in use at the Pulmonary Clinic at Walter Reed National Military Medical Center in Bethesda, MD where the current processors and other types of bronchoscopes used are compatible with Olympus products and changing to another system would require additional processors and other types of bronchoscopes with inferior qualities and capabilities.

■

This request is for the replacement of a limited portion of bronchoscopes that are currently in use in the Pulmonary Service at Walter Reed National Military Medical Center in Bethesda, MD. Olympus provides the superior endoscopes compared to other endoscopes used in DoD because Olympus endoscopes are the only non-disposable endoscopes used in GI and Pulmonary throughout the DoD. The EBUS bronchoscope is a specific type of bronchoscope used to provide standard care services to patients in the diagnosis of many diseases with abnormalities in the lungs and is essential for appropriate staging and diagnosis in deadly diseases such as lung cancer. The absence of functional EBUS bronchoscopes would result in immediate decrement to patient care.

4. This action is being conducted under the authority of the ECAT Multiple Award Schedule Program. The circumstances justifying waiving the competition requirements is FAR 8.405-6(a)(1)(i)(B) – Only one source is capable of providing the supplies required at the level of quality required because the supplies are unique or highly specialized, and FAR 8.405-6(b)(1) – Brand name specifications shall not be used unless the particular brand name, product, or feature is essential to the Government’s requirements, and market research indicates other companies’ similar products, or products lacking the particular feature, do not meet, or cannot be modified to meet, the agency’s needs. As explained below, this particular brand name product is essential to the Government’s requirements, and market research has established that other companies’ similar products cannot meet the Government’s needs. Minimum requirements for governmental use include: Flexible reusable endobronchial ultrasound bronchoscope with a minimum 2.2 mm working channel, color doppler function, compatible with existing endoscope processors and cleaning equipment.

Olympus is the market leader for Endoscopy equipment. Olympus EBUS bronchoscopes include features such as a shorter distal tip, thinner diameter (6.6mm – smallest available when compared with competitors) and unique flexion capability to 160 degrees (other brands limited to 120/130 degrees). These unique features provide improved maneuverability allowing for optimal angulation, an improved approach to difficult-to-reach target sampling sites and expanding the areas of the lung that can be biopsied with the scope. Decreased forward oblique angle of 20° facilitates easier endoscopic orientation and allows the operator to keep the endoscopic image in full field of view while navigating the airways during a procedure.

Superior needle orientation: Steeper puncture angle provides a more perpendicular needle orientation towards the target allowing for smoother target penetration between cartilage rings and other critical vessels. Largest working channel (2.2 mm) which allows for a wider range of biopsy tools and better suctioning for clearing blood and mucus from the airway and is the only EBUS bronchoscope that can accommodate the 19g needle which is essential for diagnosis requiring histological samples. The government requires a minimum of 2.2 mm working channel and Olympus competitors can only provide a maximum of 2.0 mm, meaning Olympus provides the only acceptable working channel size for government usage.

Olympus provides superior bronchoscopy equipment and is preferred for its advanced features and a comprehensive list of bronchoscope models, not just EBUS bronchoscopes. All these

scopes and accessory/processing equipment work together to allow the physicians to treat and diagnose disease and provide early detection and accurate staging for lung cancer in the most optimal manner possible. The 6.6 mm distal diameter, 160-degree angulation and 2.2 mm working channel are all unique qualities of the EBUS BF-UC190 that are essential requirements that are not available in any other commercially available EBUS bronchoscopes.

5. DLA Troop Support has already determined the prices of the supplies under the ECAT Multiple Award Schedule Program fair and reasonable based on a favorable comparison to other than certified cost or pricing data. Request for Quotation (RFQ) will be sent to all Medical/Surgical contract holders prior to placement of the delivery order to obtain better pricing. This acquisition represents the best value to the Government consistent with FAR 8.404(d).

6. Market research was conducted on [REDACTED]

7. ECAT vendors have the opportunity to add products that fall within scope of the ECAT contract regularly, thereby increasing competition. DLA Troop Support will continue to attempt to locate other acceptable sources for future requirements at Walter Reed National Military Medical Center as they arise; however, any new items would need to meet all the Walter Reed National Military Medical Center's requirements.

8. As the Contracting Officer, I hereby certify that the information contained in this justification is accurate and complete to the best of my knowledge and belief.
