

Statement of work

The Oxford Instruments, Inc. Service Contract

One of the important features of the Tescan Vega SEM at Menlo Park is the addition of two (2) Oxford X-Max-50 large area Energy Dispersive Spectrometry (EDS) detectors and one (1) Oxford Synergy Electron Back Scatter Diffractometer (EBSD). The EDS detectors allow us to collect semi-quantitative geochemical data, whereas the EBSD is used to analyze the structural/crystallographic information of specimens. These detectors and software applications allow for rapid identification of phases, determining modal abundance of phases, and application of energy filters on spectra. All detectors are fundamental tools used with the SEM, and maintaining the detectors is critical to SEM work being done efficiently on campus. Down time with the detectors would result in most of our users being unable to obtain necessary data. The EPMA/SEM Lab at Menlo Park has maintained and benefitted from a service contract with Oxford Instruments, Inc. for many years.
